

# OOPS C++ LEETCODE PROBLEMS

NAME:LITHIKA V

REG.NO:11249M026

## 1.TWO SUM

The screenshot shows a browser window for LeetCode with the URL [leetcode.com/problems/two-sum/](https://leetcode.com/problems/two-sum/). The code editor contains a C++ solution for the 'Two Sum' problem. The code uses an unordered map to store indices of elements as it iterates through the array. It returns the indices of the two numbers that add up to the target. The code is accepted with a runtime of 0 ms.

```
1 class Solution {
2 public:
3     vector<int> twoSum(vector<int>& nums, int target) {
4         unordered_map<int, int> mp; // value -> index
5
6         for (int i = 0; i < nums.size(); i++) {
7             int complement = target - nums[i];
8
9             if (mp.find(complement) != mp.end()) {
10                 return { mp[complement], i };
11             }
12         }
13     }
14 }
```

**Example 1:**  
Input: nums = [2,7,11,15], target = 9  
Output: [0,1]  
Explanation: Because nums[0] + nums[1] == 9, we return [0, 1].

**Example 2:**  
Input: nums = [3,2,4], target = 6  
Output: [1,2]

**Example 3:**  
Input: nums = [3,3], target = 6  
Output: [0,1]

## 2.ADD TWO NUMBERS

The screenshot shows a browser window for LeetCode with the URL [leetcode.com/problems/add-two-numbers/](https://leetcode.com/problems/add-two-numbers/). The code editor contains a C++ solution for the 'Add Two Numbers' problem. It adds two linked lists representing non-negative integers. The digits are stored in reverse order. The code is accepted with a runtime of 0 ms.

```
11 class Solution {
12 public:
13     ListNode* addTwoNumbers(ListNode* l1, ListNode* l2) {
14         ListNode* dummy = new ListNode(0);
15         ListNode* current = dummy;
16         int carry = 0;
17
18         while (l1 != nullptr || l2 != nullptr || carry > 0) {
19             int val = (l1 != nullptr ? l1->val : 0) + (l2 != nullptr ? l2->val : 0) + carry;
20             carry = val / 10;
21             current->next = new ListNode(val % 10);
22             current = current->next;
23             l1 = l1->next;
24             l2 = l2->next;
25         }
26
27         return dummy->next;
28     }
29 }
```

**Example 1:**  
Diagram showing two linked lists: 2 → 4 → 3 and 5 → 6 → 4. A horizontal line indicates the sum of these two lists.

### 3. EXPRESSION ADD OPERATORS

The screenshot shows a LeetCode problem page for "Expression Add Operators". The problem description asks to insert operators '+' or '-' between digits in a string to reach a target value. Examples show that for "123" and target 6, both "1+2+3" and "1+2+3" evaluate to 6. Another example for "232" and target 8 shows "2+3+2" and "2+3\*2" as valid solutions. The code editor contains a C++ solution using backtracking. The test case section shows an accepted submission with a runtime of 107 ms. The system status bar at the bottom indicates it's 11:51 AM on November 24, 2025.

```
1 class Solution {
2 public:
3     vector<string> result;
4     string num;
5     long long target;
6     void backtrack(int index, long long eval, long long last, string expr) {
7         if (index == num.size()) {
8             if (eval == target)
9                 result.push_back(expr);
10        }
11    }
12 }
```

### 4. STRING TO INTEGER

The screenshot shows a LeetCode problem page for "String to Integer (atoi)". The problem requires implementing the `myAtoi(string s)` function. The algorithm involves skipping leading whitespace, determining the sign by checking the next character, and reading the integer by skipping leading zeros until a non-digit character is encountered or the end of the string is reached. Examples include handling whitespace, determining sign, conversion, and rounding. The code editor contains a C++ solution for `myAtoi`. The test case section shows an accepted submission with a runtime of 0 ms. The system status bar at the bottom indicates it's 11:52 AM on November 24, 2025.

```
1 class Solution {
2 public:
3     int myAtoi(string s) {
4         long long num = 0; // Use long long to detect overflow
5         int i = 0, n = s.size();
6         int sign = 1;
7         // 1. Skip leading whitespace
8         ...
9     }
10 }
```

## 5.PALINDROME NUMBER

The screenshot shows a LeetCode problem page for "Palindrome Number". The code submitted is:

```
1 class Solution {
2 public:
3     bool isPalindrome(int x) {
4         // Step 1: Negative or ends with zero (except 0) cannot be palindrome
5         if (x < 0 || (x % 10 == 0 && x != 0))
6             return false;
7
8         long long reversedHalf = 0;
```

The code is accepted with a runtime of 0 ms. The input is 121 and the output is true.

## 6.LETTER COMBINATIONS OF A PHONE NUMBER

The screenshot shows a LeetCode problem page for "Letter Combinations of a Phone Number". The code submitted is:

```
1 class Solution {
2 public:
3     vector<string> result;
4     vector<string> mapping = {
5         "", "", "abc", "def", "ghi",
6         "jkl", "mno", "pqrs", "tuv", "wxyz"
7     };
8 }
```

The code is accepted with a runtime of 0 ms. The input is "23" and the output is ["ad", "ae", "af", "bd", "be", "bf", "cd", "ce", "cf"].

## 7.FINDFIRST AND LAST POSITION OF ELEMENT IN SORTED ARRAY

The screenshot shows a C++ IDE interface on a Windows desktop. The browser tab is 'oops c++ 11249M026'. The code editor contains the following C++ code for finding the first and last positions of a target value in a sorted array:

```
1 class Solution {
2 public:
3     int findFirst(vector<int>& nums, int target) {
4         int left = 0, right = nums.size() - 1, ans = -1;
5         while (left <= right) {
6             int mid = left + (right - left) / 2;
7             if (nums[mid] >= target) {
8                 if (nums[mid] == target) ans = mid;
9                 right = mid - 1;
10            }
11        }
12        return ans;
13    }
14
15    int findLast(vector<int>& nums, int target) {
16        int left = 0, right = nums.size() - 1, ans = -1;
17        while (left <= right) {
18            int mid = left + (right - left) / 2;
19            if (nums[mid] <= target) {
20                if (nums[mid] == target) ans = mid;
21                left = mid + 1;
22            }
23        }
24        return ans;
25    }
26}
```

The code is saved and the test result is 'Accepted' with runtime 0 ms. The input is [5,7,7,8,8,10] and target is 8. The output is [3,4]. The status bar shows 213 Online.

## 8.VALID SUDOKU

The screenshot shows a C++ IDE interface on a Windows desktop. The browser tab is 'oops c++ 11249M026'. The code editor contains the following C++ code for validating a 9x9 Sudoku board:

```
1 class Solution {
2 public:
3     bool isValidSudoku(vector<vector<char>>& board) {
4         vector<set<char>> rows(9), cols(9), boxes(9);
5
6         for(int r = 0; r < 9; r++){
7             for(int c = 0; c < 9; c++){
8                 char val = board[r][c];
9
10                 if(val != '.') {
11                     if(rows[r].count(val) || cols[c].count(val) || boxes[(r/3)*3 + c/3].count(val))
12                         return false;
13
14                     rows[r].insert(val);
15                     cols[c].insert(val);
16                     boxes[(r/3)*3 + c/3].insert(val);
17                 }
18             }
19         }
20
21         return true;
22     }
23}
```

The code is saved and the test result is 'Accepted' with runtime 0 ms. The input is a 9x9 grid of characters representing the Sudoku board. The output is 'true'. The status bar shows 200 Online.

## 9. MINIMUM PATH SUM

The screenshot shows a LeetCode problem page for "64. Minimum Path Sum". The problem description states: "Given a  $m \times n$  grid filled with non-negative numbers, find a path from top left to bottom right, which minimizes the sum of all numbers along its path. Note: You can only move either down or right at any point in time." An example grid is shown:

1	3	1
1	5	1
4	2	1

The code submitted is a C++ solution using dynamic programming:

```
1 class Solution {
2 public:
3     int minPathSum(vector<vector<int>>& grid) {
4         int m = grid.size();
5         int n = grid[0].size();
6         vector<vector<int>> dp(m, vector<int>(n, 0));
7         dp[0][0] = grid[0][0];
8         for (int i = 1; i < m; ++i) {
9             dp[i][0] = dp[i - 1][0] + grid[i][0];
10        }
11        for (int j = 1; j < n; ++j) {
12            dp[0][j] = dp[0][j - 1] + grid[0][j];
13        }
14        for (int i = 1; i < m; ++i) {
15            for (int j = 1; j < n; ++j) {
16                dp[i][j] = min(dp[i - 1][j], dp[i][j - 1]) + grid[i][j];
17            }
18        }
19        return dp[m - 1][n - 1];
20    }
21};
```

The test result shows "Accepted" with runtime 0 ms. The input is `grid = [[1,3,1],[1,5,1],[4,2,1]]` and the output is `7`.

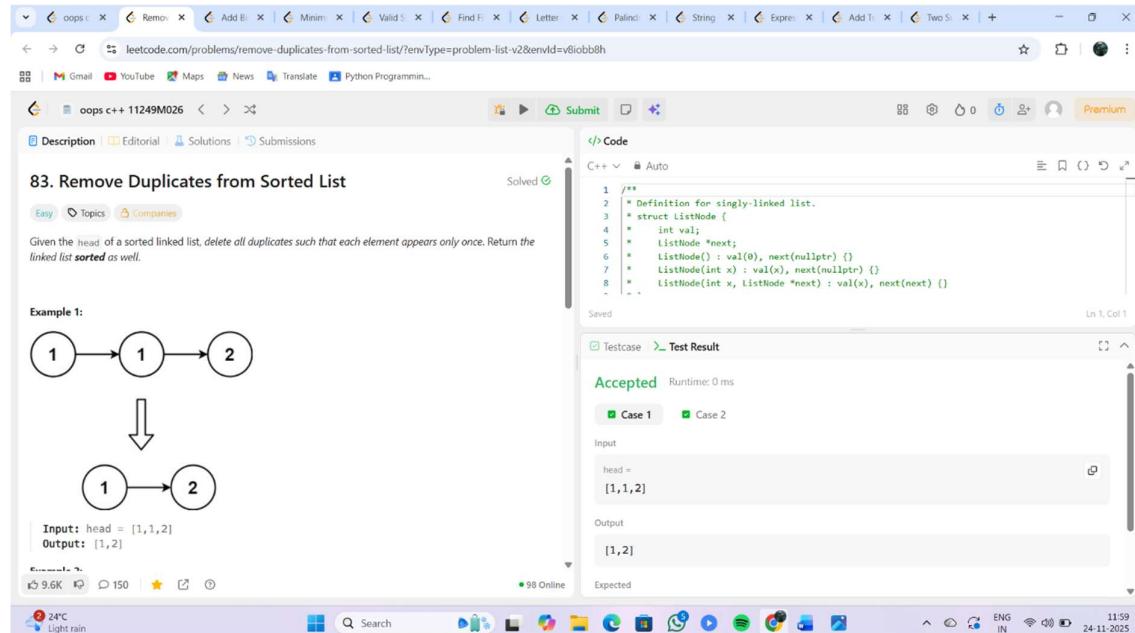

## 10. ADD BINARY

The screenshot shows a LeetCode problem page for "67. Add Binary". The problem description states: "Given two binary strings  $a$  and  $b$ , return their sum as a binary string." Example 1 shows  $a = "11"$  and  $b = "1"$  resulting in  $"100"$ . Example 2 shows  $a = "1010"$  and  $b = "1011"$  resulting in  $"10101"$ . The code submitted is a C++ solution using string manipulation:

```
1 class Solution {
2 public:
3     string addBinary(string a, string b) {
4         string result = "";
5         int i = a.size() - 1;
6         int j = b.size() - 1;
7         int carry = 0;
8         while (i >= 0 || j >= 0) {
9             if (i >= 0) {
10                 if (a[i] == '1') {
11                     carry++;
12                 }
13                 if (j >= 0) {
14                     if (b[j] == '1') {
15                         carry++;
16                     }
17                 }
18                 if (carry > 0) {
19                     result += '1';
20                 } else {
21                     result += '0';
22                 }
23             }
24             i--;
25             j--;
26         }
27         if (carry > 0) {
28             result += '1';
29         }
30         reverse(result.begin(), result.end());
31         return result;
32     }
33};
```

The test result shows "Accepted" with runtime 0 ms. The input is `a = "11"` and `b = "1"` with the output being `"100"`.

## 11. REMOVE DUPLICATES FROM SORTED LIST

83. Remove Duplicates from Sorted List

Solved

Example 1:

```
1 /**
2 * Definition for singly-linked list.
3 * struct ListNode {
4 *     int val;
5 *     ListNode *next;
6 *     ListNode() : val(0), next(nullptr) {}
7 *     ListNode(int x) : val(x), next(nullptr) {}
8 *     ListNode(int x, ListNode *next) : val(x), next(next) {}
9 *
```

Input: head = [1, 1, 2]  
Output: [1, 2]

Accepted Runtime: 0 ms

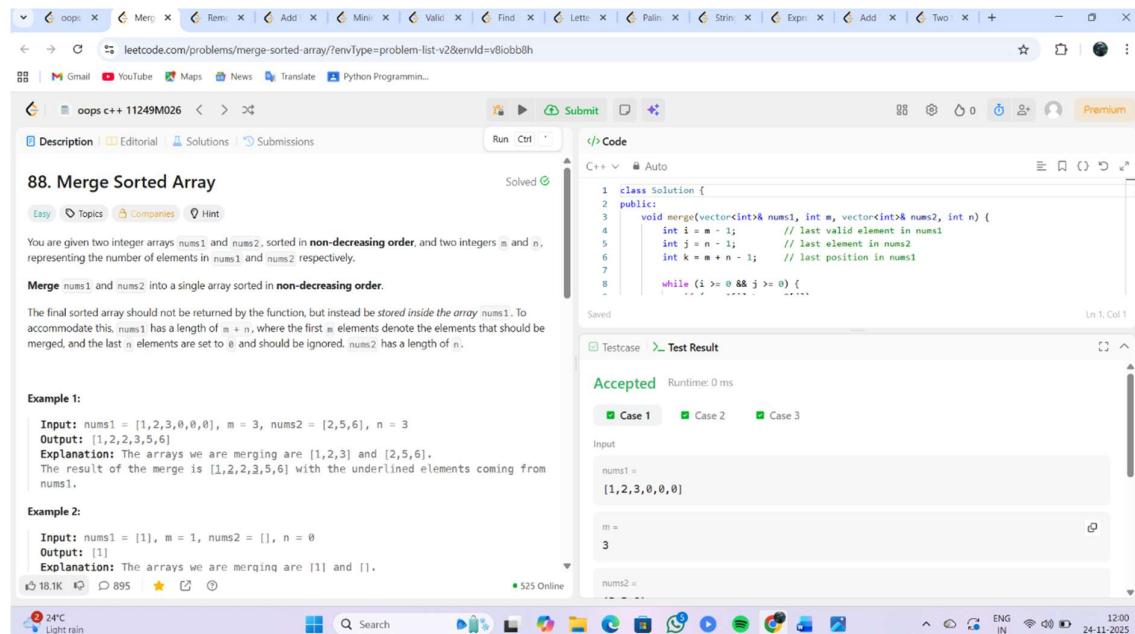

Case 1 Case 2

Input  
head = [1,1,2]

Output  
[1,2]

Expected

## 12. MERGE SORTED ARRAY

88. Merge Sorted Array

Solved

Merge nums1 and nums2 into a single array sorted in non-decreasing order.

The final sorted array should not be returned by the function, but instead be stored *inside the array* nums1. To accommodate this, nums1 has a length of  $m + n$ , where the first  $m$  elements denote the elements that should be merged, and the last  $n$  elements are set to 0 and should be ignored. nums2 has a length of  $n$ .

Example 1:

```
1 class Solution {
2 public:
3     void merge(vector<int>& nums1, int m, vector<int>& nums2, int n) {
4         int i = m - 1;           // last valid element in nums1
5         int j = n - 1;           // last element in nums2
6         int k = m + n - 1;       // last position in nums1
7
8         while (i >= 0 && j >= 0) {
9             ...
10            ...
11        }
12    }
13 }
```

Input  
nums1 = [1, 2, 3, 0, 0, 0], m = 3, nums2 = [2, 5, 6], n = 3

Output  
[1, 2, 2, 3, 5, 6]

Explanation: The arrays we are merging are [1,2,3] and [2,5,6]. The result of the merge is [1,2,2,3,5,6] with the underlined elements coming from nums1.

Example 2:

```
1 Input: nums1 = [1], m = 1, nums2 = [], n = 0
2 Output: [1]
3 Explanation: The arrays we are merging are [1] and [].
```

Accepted Runtime: 0 ms

Case 1 Case 2 Case 3

Input  
nums1 = [1, 2, 3, 0, 0, 0]

m = 3

nums2 =

## 13.GRAY CODE

The screenshot shows a LeetCode problem page for "89. Gray Code". The code editor contains the following C++ code:

```
1 class Solution {
2 public:
3     vector<int> grayCode(int n) {
4         vector<int> result;
5         int size = 1 << n; // 2^n
6
7         for (int i = 0; i < size; i++) {
8             result.push_back(i ^ (i >> 1));
9         }
10    }
11}
```

The test result section shows "Accepted" status with runtime 0 ms, passing both Case 1 and Case 2. The input is n = 2, and the output is [0,1,3,2]. The expected output is also [0,1,3,2]. The page includes a sidebar with Medium, Topics, and Companies tabs, and a bottom navigation bar with various links.

## 14.REVERSE LINKED LIST

The screenshot shows a LeetCode problem page for "92. Reverse Linked List II". The code editor contains the following C++ code:

```
1 /**
2  * Definition for singly-linked list.
3  * struct ListNode {
4  *     int val;
5  *     ListNode *next;
6  *     ListNode() : val(0), next(nullptr) {}
7  *     ListNode(int x) : val(x), next(nullptr) {}
8  *     ListNode(int x, ListNode *next) : val(x), next(next) {}
9  * };
10
```

The test result section shows "Accepted" status with runtime 0 ms, passing both Case 1 and Case 2. The input is head = [1,2,3,4,5], left = 2, right = 4, and the output is [1,4,3,2,5]. The page includes a sidebar with Medium, Topics, and Companies tabs, and a bottom navigation bar with various links.

## 15.BINARY TREE INORDER TRAVERSAL

The screenshot shows a LeetCode problem page for "Binary Tree Inorder Traversal". The code submitted is a C++ implementation of an inorder traversal algorithm. The test results show the code is accepted with a runtime of 0 ms across four test cases. The input is [1,null,2,3] and the output is [1,3,2].

```
C++ v Auto
13 class Solution {
14 public:
15     void inorder(TreeNode* root, vector<int>& result) {
16         if (!root) return;
17         inorder(root->left, result);
18         result.push_back(root->val);
19         inorder(root->right, result);
20     }
21 }
```

**Accepted** Runtime: 0 ms

Case 1 Case 2 Case 3 Case 4

Input  
root =  
[1,null,2,3]

Output  
[1,3,2]

Expected

## 16.PASCAL'S TRIANGLE

The screenshot shows a LeetCode problem page for "Pascal's Triangle". The code submitted is a C++ implementation that generates the first numRows of Pascal's triangle using vectors. The test results show the code is accepted with a runtime of 0 ms across two test cases. The input is numRows = 5 and the output is [[1],[1,1],[1,2,1],[1,3,3,1],[1,4,6,4,1]].

```
C++ v Auto
1 class Solution {
2 public:
3     vector<vector<int>> generate(int numRows) {
4         vector<vector<int>> triangle(numRows);
5         for (int i = 0; i < numRows; i++) {
6             triangle[i].resize(i + 1); // row size
7             triangle[i][0] = triangle[i][i] = 1; // first and last are always 1
8         }
9     }
10 }
```

**Accepted** Runtime: 0 ms

Case 1 Case 2

Input  
numRows =  
5

Output  
[[1],[1,1],[1,2,1],[1,3,3,1],[1,4,6,4,1]]

Expected

## 17.PASCAL'S TRIANGLE 2

The screenshot shows a LeetCode problem page for "Pascal's Triangle II". The problem description asks for the  $\text{rowIndex}^{\text{th}}$  row of Pascal's triangle. Below the description is a diagram of a hexagonal Pascal's triangle where each number is the sum of the two numbers directly above it. An example shows the 3rd row output as [1, 3, 3, 1]. The code editor contains a C++ solution using dynamic programming. The test result shows the code was accepted with a runtime of 0 ms.

```
class Solution {
public:
    vector<int>getRow(int rowIndex) {
        vector<int> row(rowIndex + 1);
        for (int i = 2; i <= rowIndex; i++) {
            // Update from right to left
            for (int j = i - 1; j >= 1; j--) {
                ...
            }
        }
        return row;
    }
};
```

Testcase: rowIndex = 3  
Input: rowIndex = 3  
Output: [1,3,3,1]

Accepted Runtime: 0 ms  
Case 1 Case 2 Case 3

Input: rowIndex = 3  
Output: [1,3,3,1]  
Expected: [1,3,3,1]

## 18.TRIANGLE

The screenshot shows a LeetCode problem page for "Triangle". The problem description asks for the minimum path sum from top to bottom in a triangle array. The code editor contains a C++ solution using dynamic programming. The test result shows the code was accepted with a runtime of 0 ms.

```
class Solution {
public:
    int minimumTotal(vector<vector<int>>& triangle) {
        int n = triangle.size();
        vector<int> dp = triangle.back(); // start from last row
        // bottom-up DP
        for (int row = n - 2; row >= 0; row--) {
            for (int col = 0; col <= row; col++) {
                dp[col] = min(dp[col], dp[col + 1]) + triangle[row][col];
            }
        }
        return dp[0];
    }
};
```

Testcase: triangle = [[2],[3,4],[6,5,7],[4,1,8,3]]  
Input: triangle = [[2],[3,4],[6,5,7],[4,1,8,3]]  
Output: 11  
Expected: 11

Accepted Runtime: 0 ms  
Case 1 Case 2

Input: triangle = [[2],[3,4],[6,5,7],[4,1,8,3]]  
Output: 11  
Expected: 11

## 19.VALID PALINDROME

The screenshot shows the LeetCode platform with the problem "125. Valid Palindrome". The code submitted is a C++ solution for checking if a string is a palindrome. It converts the string to lowercase, removes non-alphanumeric characters, and then compares characters from both ends moving inward. The code is accepted with a runtime of 0 ms.

```
1 class Solution {
2     public:
3         bool isPalindrome(string s) {
4             int left = 0, right = s.size() - 1;
5             while (left < right) {
6                 // move left pointer to next alphanumeric
7                 while (left < right && !isalnum(s[left])) {

## 20.COPY LIST WITH RANDOM POINTER

The screenshot shows the LeetCode platform with the problem "138. Copy List with Random Pointer". The code submitted is a C++ solution for copying a linked list with random pointers. It uses a deep copy approach where each new node has its value set to the value of its corresponding original node. Both the `next` and `random` pointers of the new nodes should point to new nodes in the copied list such that the pointers in the original list and copied list represent the same list state. The code is accepted with a runtime of 0 ms.

```
1 /*
2  * Definition for a Node.
3  * class Node {
4  * public:
5  *     int val;
6  *     Node* next;
7  *     Node* random;
8  * };
9 */
10
11 Node* copyRandomList(Node* head) {
12     if (!head) return NULL;
13
14     Node* curr = head;
15     while (curr) {
16         Node* copy = new Node(curr->val);
17         copy->next = curr->next;
18         curr->next = copy;
19         curr = copy->next;
20     }
21
22     curr = head;
23     while (curr) {
24         if (curr->random) {
25             curr->copy->random = curr->random->copy;
26         } else {
27             curr->copy->random = NULL;
28         }
29         curr = curr->next;
30     }
31
32     curr = head;
33     while (curr) {
34         curr->next = curr->copy;
35         curr->copy->next = curr->next->copy;
36         curr = curr->next->copy;
37     }
38
39     return head->copy;
40 }
```

**Testcase** **Test Result**  
Accepted Runtime: 0 ms  
Case 1 Case 2 Case 3

**Input**  
head =  
[[7,null],[13,0],[11,4],[10,2],[1,0]]

**Output**  
[[7,null],[13,0],[11,4],[10,2],[1,0]]

**Expected**

## 21.INSERTION SORT LIST

The screenshot shows a LeetCode problem page for "147. Insertion Sort List". The code submitted is a C++ implementation of insertion sort for singly-linked lists. The test case input is [4,2,1,3] and the output is [1,2,3,4]. The result is "Accepted" with a runtime of 0 ms. The code editor shows the following code:

```
1  /*
2  * Definition for singly-linked list.
3  * struct ListNode {
4  *     int val;
5  *     ListNode *next;
6  *     ListNode() : val(0), next(nullptr) {}
7  *     ListNode(int x) : val(x), next(nullptr) {}
8  *     ListNode(int x, ListNode *next) : val(x), next(next) {}
9  */
```

## 22.REVERSE WORDS IN A STRING

The screenshot shows a LeetCode problem page for "151. Reverse Words in a String". The code submitted is a C++ implementation that reverses words in a string. The test case input is "the sky is blue" and the output is "blue is sky the". The result is "Accepted" with a runtime of 0 ms. The code editor shows the following code:

```
1 class Solution {
2 public:
3     string reverseWords(string s) {
4         vector<string> words;
5         string word = "";
6
7         // Extract words (ignore extra spaces)
8         for (char c : s) {
9             if (c == ' ') {
10                 if (!word.empty())
11                     words.push_back(word);
12                 word = "";
13             } else
14                 word += c;
15         }
16
17         if (!word.empty())
18             words.push_back(word);
19
20         reverse(words.begin(), words.end());
21
22         string ans;
23         for (const string &w : words)
24             ans += w + " ";
25
26         return ans;
27     }
28 }
```

## 23.MAXIMUM PRODUCT SUBARRAY

```
#include <vector>
#include <algorithm>
using namespace std;
class Solution {
public:
    int maxProduct(vector<int>& nums) {
        int maxProd = nums[0];
        for (int i = 0, j = 0; i < nums.size(); i = j) {
            int prod = 1;
            while (j < nums.size() && prod <= maxProd) {
                prod *= nums[j];
                j++;
            }
            if (prod > maxProd) maxProd = prod;
        }
        return maxProd;
    }
}
```

Accepted Runtime: 0 ms

Case 1 Case 2

Input: nums = [2,3,-2,4]

Output: 6

Expected: 6

## 24.FIND MINIMUM IN ROTATED SORTED ARRAY

```
#include <vector>
using namespace std;
class Solution {
public:
    int findMin(vector<int>& nums) {
        int left = 0, right = nums.size() - 1;
        while (left < right) {
            int mid = left + (right - left) / 2;
            if (nums[mid] > nums[right]) left = mid + 1;
            else right = mid;
        }
        return nums[left];
    }
}
```

Accepted Runtime: 0 ms

Case 1 Case 2 Case 3

Input: nums = [3,4,5,1,2]

Output: 1

Expected: 1

## 25. INTEGER TO ROMAN

The screenshot shows a LeetCode problem page for "Integer to Roman". The code is as follows:

```
1 #include <string>
2 #include <vector>
3 using namespace std;
4
5 class Solution {
6 public:
7     string intToRoman(int num) {
8         vector<int> values = {1000, 900, 500, 400, 100, 90, 50, 40, 10, 9, 5, 4, 1};
9     }
10 }
```

The output for input 3749 is IIIIDCCXLIX".

## 26. ROMAN TO INTEGER

The screenshot shows a browser window with multiple tabs open, all related to the LeetCode problem "Roman to Integer". The main content area displays the problem statement, a truth table, and the user's C++ solution code. The code is accepted, with a runtime of 0 ms. The browser interface includes a navigation bar, search bar, and various extension icons.

**13. Roman to Integer**

Roman numerals are represented by seven different symbols: I, V, X, L, C, D and M.

Symbol	Value
I	1
V	5
X	10
L	50
C	100
D	500
M	1000

For example, 2 is written as II in Roman numeral, just two ones added together. 12 is written as XII, which is simply X + II. The number 27 is written as XXVII, which is XX + V + II.

Roman numerals are usually written largest to smallest from left to right. However, the numeral for four is not IIII. Instead, the number four is written as IV. Because the one is before the five we subtract it making four. The same principle applies to the number nine, which is written as IX. There are six instances where subtraction is used:

- I can be placed before V (5) and X (10) to make 4 and 9.
- X can be placed before L (50) and C (100) to make 40 and 90.
- C can be placed before D (500) and M (1000) to make 400 and 900.
